

Python: warm-up exercises on iteration

This notebook was generated in solutions mode.

Exercise: Coin Flipping Simulation

Exercise Description

Write a piece of code that simulates coin tosses and keeps track of heads and tails.

Requirements:

- Use a variable `n` to specify the number of coin tosses
- Keep track of the number of heads and tails
- Use `random.randint(1, 100)` to simulate coin tosses (>50 = heads, ≤ 50 = tails)
- Store the final counts in variables `heads` and `tails`
- Return the variables `heads` and `tails`

Your solution

```
import random

def simulate_coin_flips(n):
    heads = 0
    tails = 0
    for _ in range(n):
        x = random.randint(1, 100)
        if x > 50:
            heads += 1
        else:
            tails += 1
    return heads, tails
```

Test your solution

```
# Test that heads + tails equals total number of tosses
n = 10
heads, tails = simulate_coin_flips(n)
total_tosses = heads + tails
```

```
assert total_tosses == n, f"Expected {n} total tosses, got {total_tosses}"
assert heads >= 0 and tails >= 0, 'Counts should be non-negative'
print('Test passed: coin flipping simulation works correctly!')
```

Debug your solution

The following cells contain code to generate links to Python Tutor for debugging your code when running the tests. You need to first run the cell containing your solution code before running the cell containing the Python Tutor link.

```
from IPython.display import HTML;import urllib.parse as u;HTML('<a href="https://pythontutor.'
```

Exercise: Sum of Number Sequence

Exercise Description

Write a piece of code that calculates the sum of a sequence of numbers.

Requirements:

- Keep track of the sum of numbers processed so far
- Stop when you encounter 0 (don't include 0 in the sum)
- Store the final sum in a variable called `total_sum`
- Return `total_sum`

Your solution

```
def sum_until_zero(numbers):  
    total_sum = 0  
    for number in numbers:  
        if number == 0:  
            break  
        total_sum += number  
    return total_sum
```

Test your solution

```
numbers = [5, 3, 8, 2, 0]  
total_sum = sum_until_zero(numbers)  
expected_sum = 18  
assert total_sum == expected_sum, f"Expected sum {expected_sum}, got {total_sum}"  
print('Test passed: sum calculation works correctly!')
```

Debug your solution

The following cells contain code to generate links to Python Tutor for debugging your code when running the tests. You need to first run the cell containing your solution code before running the cell containing the

Python Tutor link.

```
from IPython.display import HTML;import urllib.parse as u;HTML('<a href="https://pythontutor.'
```

Exercise: Count Odd and Even Numbers

Exercise Description

Write a piece of code that counts the number of odd and even numbers in a given range.

Requirements:

- Count numbers in the range from 1 to n (inclusive)
- Count how many numbers are odd and how many are even
- Store the counts in variables `odd_count` and `even_count`
- Return the variables `odd_count` and `even_count`

Your solution

```
def count_odd_even(n):  
    odd_count = 0  
    even_count = 0  
    for i in range(1, n + 1):  
        if i % 2 == 0:
```

```
        even_count += 1
    else:
        odd_count += 1
    return odd_count, even_count
```

Test your solution

```
n = 10
odd_count, even_count = count_odd_even(n)
assert odd_count == 5, f"Expected 5 odd numbers, got {odd_count}"
assert even_count == 5, f"Expected 5 even numbers, got {even_count}"
assert odd_count + even_count == n, f"Total count should equal {n}"
print('Test passed: odd/even counting works correctly!')
```

Debug your solution

The following cells contain code to generate links to Python Tutor for debugging your code when running the tests. You need to first run the cell containing your solution code before running the cell containing the Python Tutor link.

```
from IPython.display import HTML;import urllib.parse as u;HTML('<a href="https://pythontutor.'
```

Exercise: Generate Fibonacci Sequence

Exercise Description

Write a piece of code that generates the first n numbers of the Fibonacci sequence.

Requirements:

- Generate the first 7 Fibonacci numbers
- The Fibonacci sequence starts with 0 and 1, then each subsequent number is the sum of the two preceding ones
- Store all the generated numbers in a list called `fibonacci_numbers`
- For `n=7`, the sequence should be: [0, 1, 1, 2, 3, 5, 8]
- Return the variable `fibonacci_numbers`

Definition: Each number in the Fibonacci sequence is given by the sum of the two preceding ones. \The Fibonacci sequence starts with two 'seed' numbers 0 and 1) and then the proper sequence starts: 0, 1, 1, 2, 3, 5, 8, 13, 21, ...

Your solution

```
def fibonacci(n):  
    res = []  
    if n >= 1:  
        res.append(0)  
    if n >= 2:  
        res.append(1)  
    for i in range(2, n):
```

```
        res.append(res[i-1] + res[i-2])
    return res
```

Test your solution

```
n = 7
fibonacci_numbers = fibonacci(n)
expected_sequence = [0, 1, 1, 2, 3, 5, 8]
assert fibonacci_numbers == expected_sequence, f"Expected {expected_sequence}, got {fibonacci_numbers}"
assert len(fibonacci_numbers) == n, f"Expected {n} numbers, got {len(fibonacci_numbers)}"
print('Test passed: Fibonacci sequence generation works correctly!')
```

Debug your solution

The following cells contain code to generate links to Python Tutor for debugging your code when running the tests. You need to first run the cell containing your solution code before running the cell containing the Python Tutor link.

```
from IPython.display import HTML;import urllib.parse as u;HTML('<a href="https://pythontutor.com?code={code}&input={input}&mode=edit"')'
```

Exercise: Multiples of 3 and 5

Exercise Description

Write a piece of code that processes numbers from 1 to n and creates a result list based on multiples.

Requirements:

- Process integers from 1 to n
- For multiples of both 3 and 5, add 'Mult35' to the result
- For multiples of 3 only, add 'Mult3' to the result
- For multiples of 5 only, add 'Mult5' to the result
- For other numbers, add the number itself to the result
- Store all results in a list called `result` and return it

Your solution

```
def classify_multiples(n):  
    result = []  
    for num in range(1, n + 1):  
        if num % 3 == 0 and num % 5 == 0:  
            result.append('Mult35')  
        elif num % 3 == 0:  
            result.append('Mult3')  
        elif num % 5 == 0:  
            result.append('Mult5')  
        else:  
            result.append(num)  
    return result
```

Test your solution

```
n = 15
result = classify_multiples(n)
assert result[14] == 'Mult35', f"Expected 'Mult35' at position 14, got {result[14]}"
assert result[2] == 'Mult3', f"Expected 'Mult3' at position 2, got {result[2]}"
assert result[4] == 'Mult5', f"Expected 'Mult5' at position 4, got {result[4]}"
assert len(result) == n, f"Expected {n} elements, got {len(result)}"
print('Test passed: multiples classification works correctly!')
```

Debug your solution

The following cells contain code to generate links to Python Tutor for debugging your code when running the tests. You need to first run the cell containing your solution code before running the cell containing the Python Tutor link.

```
from IPython.display import HTML;import urllib.parse as u;HTML('<a href="https://pythontutor.'
```

Exercise: Print Number Subset

Exercise Description

Write a piece of code that scans through a range of numbers but only collects a subset.

Requirements:

- Scan all integers from 1 to n
- Only collect numbers from 1 to m (where $m \leq n$)
- Store the collected numbers in a list called `subset_numbers` and return it

Your solution

```
def collect_subset(n, m):  
    subset = []  
    for num in range(1, n + 1):  
        if num <= m:  
            subset.append(num)  
    return subset
```

Test your solution

```
n = 10  
m = 6  
subset_numbers = collect_subset(n, m)  
expected_subset = [1, 2, 3, 4, 5, 6]  
assert subset_numbers == expected_subset, f"Expected {expected_subset}, got {subset_numbers}"  
assert len(subset_numbers) == m, f"Expected {m} numbers, got {len(subset_numbers)}"  
assert max(subset_numbers) == m, f"Expected max value {m}, got {max(subset_numbers)}"  
print('Test passed: subset collection works correctly!')
```

Debug your solution

The following cells contain code to generate links to Python Tutor for debugging your code when running the tests. You need to first run the cell containing your solution code before running the cell containing the Python Tutor link.

```
from IPython.display import HTML;import urllib.parse as u;HTML('<a href="https://pythontutor.'
```

Exercise: Find Prime Numbers

Exercise Description

Write a piece of code that finds all prime numbers smaller than a given number n .

Requirements:

- Find all prime numbers smaller than n
- A prime number is greater than 1 and has no divisors other than 1 and itself
- Store all found prime numbers in a list called `prime_numbers` and return it
- Use a simple primality test: check if a number is divisible by any number from 2 to $n/2$

Your solution

```
def primes_less_than(n):  
    prime_numbers = []  
    for num in range(2, n):
```

```
is_prime = True
for d in range(2, num // 2 + 1):
    if num % d == 0:
        is_prime = False
        break
if is_prime:
    prime_numbers.append(num)
return prime_numbers
```

Test your solution

```
n = 15
prime_numbers = primes_less_than(n)
expected_primes = [2, 3, 5, 7, 11, 13]
assert prime_numbers == expected_primes, f"Expected {expected_primes}, got {prime_numbers}"
assert all(p < n for p in prime_numbers), 'All primes should be less than n'
print('Test passed: prime number finding works correctly!')
```

Debug your solution

The following cells contain code to generate links to Python Tutor for debugging your code when running the tests. You need to first run the cell containing your solution code before running the cell containing the Python Tutor link.

```
from IPython.display import HTML;import urllib.parse as u;HTML('<a href="https://pythontutor.'
```

Exercise: Find Pythagorean Triples

Exercise Description

Write a piece of code that finds all Pythagorean triples for a given number n .

Requirements:

- Find all pairs (x, y) such that $x^2 + y^2 = n^2$
- Both x and y should be positive integers less than n
- Store all valid pairs as tuples in a list called `pythagorean_pairs` and return it
- A Pythagorean triple consists of three positive integers x , y , and n such that $x^2 + y^2 = n^2$

Your solution

```
def pythagorean_pairs(n):  
    pairs = []  
    for x in range(1, n):  
        for y in range(1, n):  
            if x**2 + y**2 == n**2:  
                pairs.append((x, y))  
    return pairs
```

Test your solution
